Superlineation and morph division

The supralinear stroke is U+0305 (combining overline); Layton's morph-dividing hyphen is the ordinary U+002D, and his prepersonal-state sign = is U+2E17 (double oblique hyphen): CΩΤΠ-, CΩΤΠ=.

Fidelity

The same word, printed and revived. Above: ΠΟΝΗΡΟΣ as it appears in the book (600 dpi scan). Below: the same word set in this font at matching letter height.

ΠΟΝΗΡΟΣ

ΠΟΝΗΡΟΣ

Measured against the alphabet table on p. 13 of the *Grammar* — held out from the harvest, which used only pp. 60–540:

	this font	best installed	ceiling
glyph-shape agreement	0.877	0.816	~0.95
with proportion	0.868	0.806	
identity rate	1.00	0.90	
stroke weight vs page	0.93	0.69	
set width vs page	0.98	0.95	

Best installed = CS Koptos Manuscript Unicode, the closest of the 27 Coptic-capable fonts on this machine. Ceiling = what a true match scores against a scan of this quality. Identity rate = share of the 30 glyphs closer to their own printed counterpart than to any other letter. Weight 0.93 = 7 % less ink than the printed impression, with the page's own thick/thin ratio kept; v1.2 scored 0.859 and v1.0 (as printed) 0.874, both tagged in git.

Built from 83,569 glyph instances harvested from 481 pages of the *Grammar* and three spreads of *Zostrien* (BCNH 24); 14,159 were registered and averaged into the templates. Advance widths are medians over 45,744 measured letter pairs. 1000 upem · letter height 620 · descender –265
